

farmhand

The upgraded system will make operating your Freight Farm simpler than ever.

Core Features

Crop Management

The new Recipes feature offers pre-set environmental programming for growing various plants.

The Crops feature helps you to configure, organize, and track each sowing and harvest, working backward from your desired yield to tell you how many panels you need to dedicate to each crop and how many seeds of each you need to plant.

The Almanac feature gives a complete picture of your farm's history. It offers a look back at sensor data, farm automations, and activities performed by your operators. You can view all of your harvest and profit data over time for a synthesis of your historical yields and revenue. All of these new features will help you to create the best plan for your growing business.

Task Management

This business management feature allows you to create and assign in-farm tasks to operators, and then helps you to track their completion and task history within the farm.

Support

We'll be continuing to add new features to the upgraded farmhand to make farming simpler and more straightforward for you. The same resources you've come to rely on, like farmhand® Academy, Knowledge Base, Community, and Shop, will still be available to you through the app — along with new features that we're confident will contribute to your success.

Operating Platform

You can now access the new farmhand® on web, iOS, and Android.

Upgrading to Farmhand Enterprise in 3 Steps:

Head to farmhand Shop to purchase your farmhand Hub, which comes with all the hardware you'll need to upgrade your farm.

Once the order ships, schedule a call with Client Services to complete the installation of your farmhand Hub.

Install your farm's hardware and complete your account upgrade with help from a dedicated Client Services representative.
